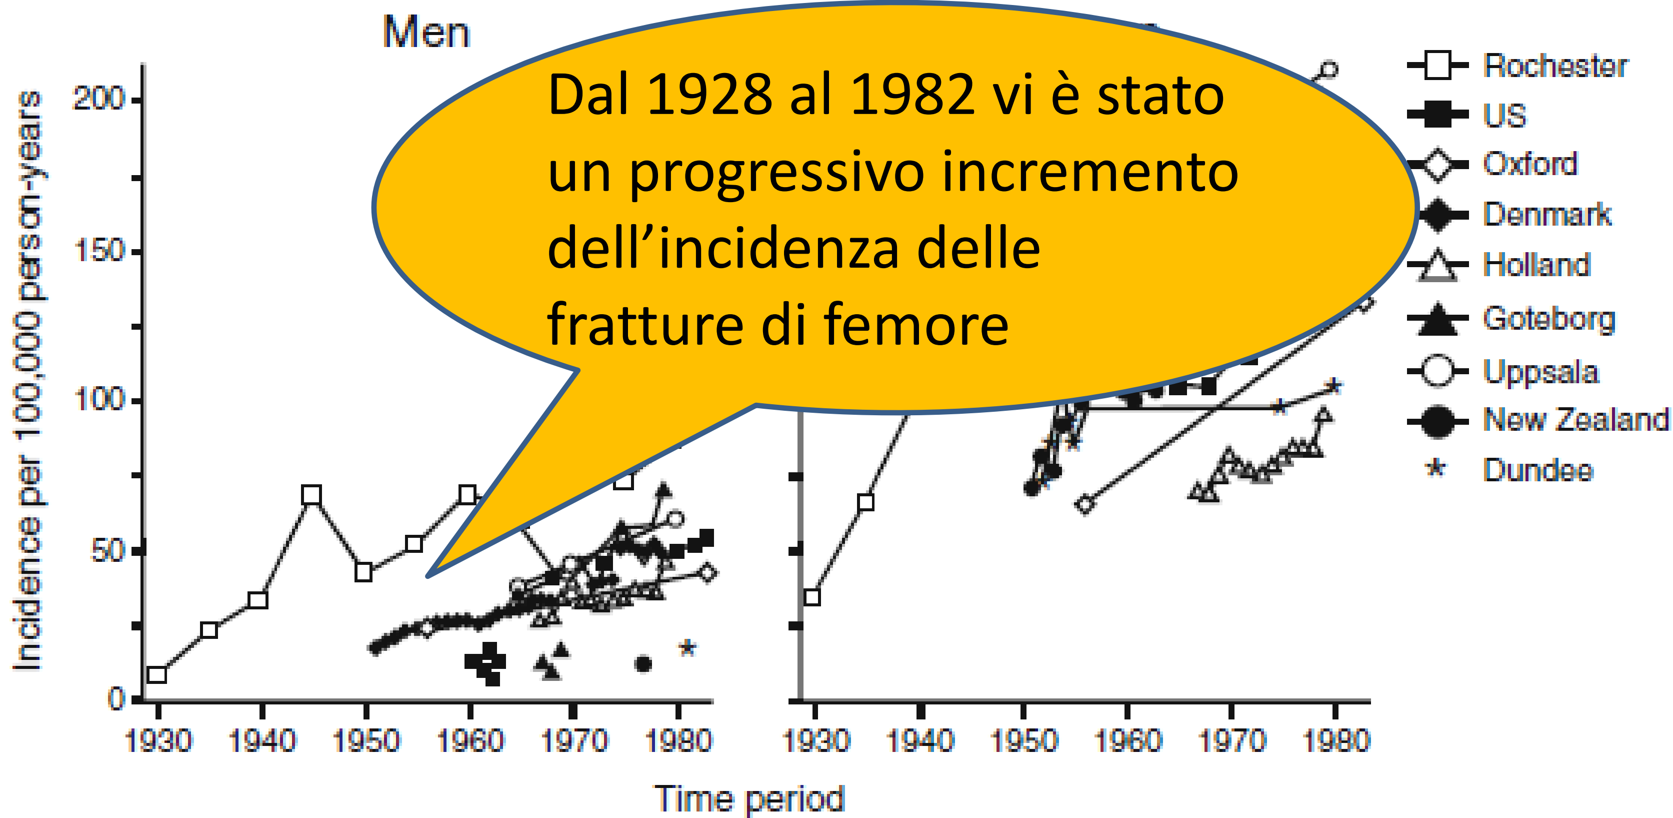
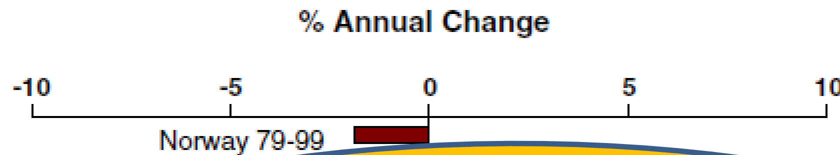
Secular trends in the incidence of HF: 1928-1982



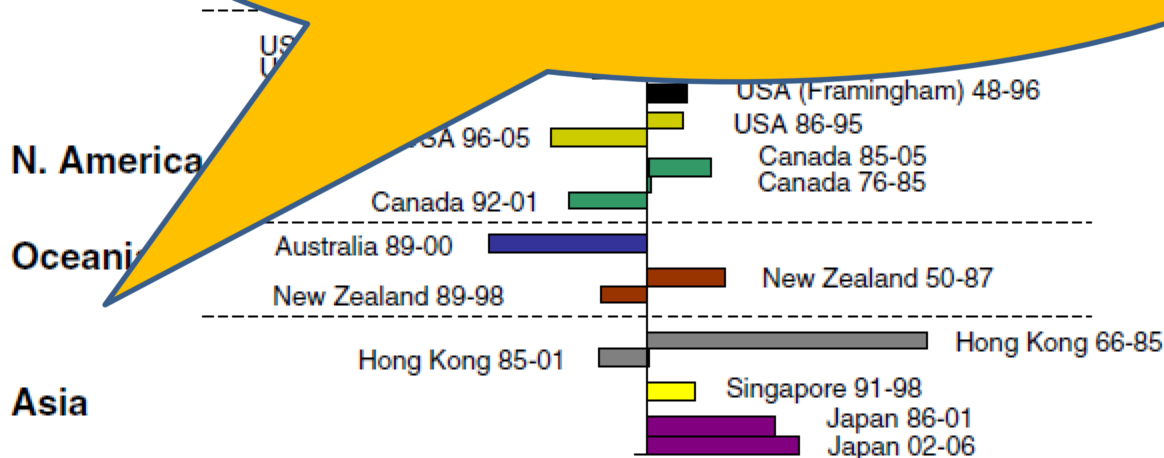
Adapted from Melton 1987

Secular trends in HF worldwide: annual change in age- and sex- adjusted HF incidence

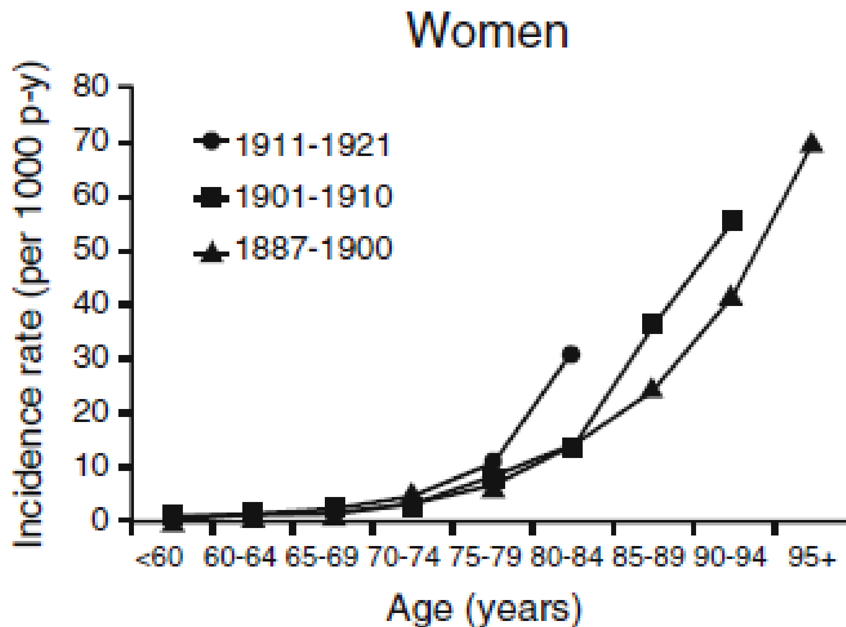
Cooper Osteop Internat 2011

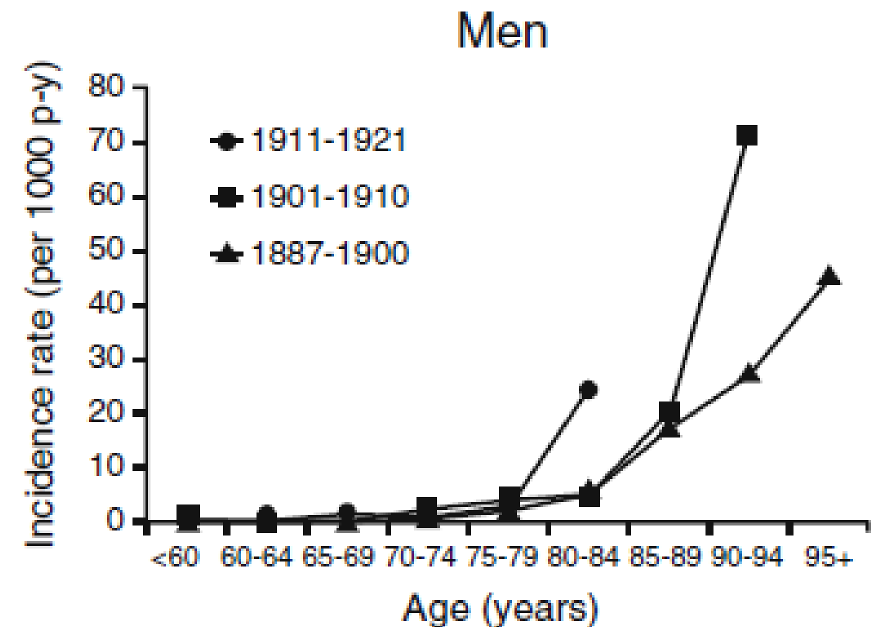


Negli ultimi due decenni l’incidenza delle fratture di femore nei paesi occidentali è andata riducendosi seppure in modo differente tra stati; in aumento in Asia



Il numero assoluto di persone anziane in cui si verificheranno HF è in aumento





Cooper Osteop Internat 2011

Trends in risk-adjusted mortality at 30, 180 and 360 days

Considerazioni

- L'incidenza delle fratture di femore è in lieve riduzione in alcuni paesi occidentali (in questi ultimi anni) ma il numero assoluto aumenterà perché la frattura di femore è una problematica età correlata
- Il primo anno dopo una frattura di femore è il più critico per l'elevato tasso di mortalità intra ed extra-ospedaliera e per la disabilità correlata
- I pazienti che sviluppano frattura di femore sono più fragili rispetto ai corrispettivi di pari età e tendono ad avere sempre più complicanze nel corso degli anni

I costi dovuti a fratture di femore anziani (>65 anni) sono elevati

	Numeri assoluti (Italia, 2002)
Numero di ricoveri per frattura femorale	80.800
Costi diretti relativi ai ricoveri (euro)	394.000.000 euro
Costi di 1 mese di riabilitazione post-operatoria (escluso 5% di mortalità acuta)	412.000.000 euro
Costi sociali (pensioni di invalidità e accompagnamento)*	108.000.000 euro
Costi indiretti (20% dei costi diretti totali)	183.000.000 euro
Stima dei costi totali	1.097.000.000 euro

*per i 18.000 pazienti stimati disabili ogni anno

Why Orthogeriatrics?

- ....a simple fall, most commonly at home, marks the beginning of a ***complex journey of care***. This takes patients through the accident and emergency (A&E) department, to an orthopedic ward, to an operating theatre, to a ward again and then -depending on the circumstances of the patient and the nature of the services available- back home either directly or via more extended in-patient rehabilitation , or to an alternative placement within the private or voluntary sector, or local authority or NHS care.

Scottish Intercollegiate Guidelines Network, 2009

Le fratture di femore sono gravate da un tasso elevato di complicanze mediche

Table 2. Patient-Specific Index Complications and Mortality in 8930 Patients Undergoing Hip Fracture Repair*

Index Complication	No. of Patients (% of Total)	30-d Mortality, % (95% CI)	1-y Mortality, % (95% CI)

Il grado di anemia condiziona il recupero funzionale

Table 2. Associations between anaemia, functional mobility and mobilization on the first three post-operative days in 487 hip fracture patients

		Walking independently	Walking with human assistance	Not able to walk	P	Mobilisation (hours out of bed)	
1st post-operative day	No anaemia $n = 317$	52 (16%)	160 (51%)	105 (33%)	0.049	3 (1–5)	0.011
	Anaemia $n = 170$	9 (5%)	103 (61%)	58 (34%)		2 (0.5–4.5)	
2nd post-operative day	No anaemia $n = 330$	82 (25%)	175 (53%)	73 (22%)	0.007	4 (2–6)	0.024
	Anaemia $n = 132$	24 (18%)	62 (47%)	46 (35%)		3 (1–5.5)	
3rd post-operative day	No anaemia $n = 314$	124 (40%)	130 (41%)	60 (19%)	0.001	5 (3–7)	0.129
	Anaemia $n = 116$	30 (26%)	47 (41%)	39 (34%)		4 (2.5–6)	

Anaemia defined to be present in any patient who on that given day had a hb measurement of <100 g/l. Data are presented as number of patients (%) for categorical variables and as median (25–75% quartiles) for continuous data. Test for statistical significance performed with chi-square corrected for linear-by-linear association for categorical data.

Relationship Between Pain and Opioid Analgesics on the Development of Delirium Following Hip Fracture

R. Sean Morrison,[1] Jay Magaziner,[2] Marvin Gilbert,[3] Kenneth J. Koval,[4] Mary Ann McLaughlin,[1] Gretchen Orosz,[1] Elton Strauss,[3] and Albert L. Siu[5]

Background. Delirium and pain are common following hip fracture. Untreated pain has been shown to increase the risk of delirium in older adults undergoing elective surgery. This study was performed to examine the relationship among pain, analgesics, and other factors on delirium in hip fracture patients.

Methods. We conducted a prospective cohort study at four New York hospitals that enrolled 541 patients with hip fracture and without delirium. Delirium was identified prospectively by patient interview supplemented by medical record review. Multiple logistic regression was used to identify risk factors.

Results. Eighty-seven of 541 patients (16%) became delirious. Among all subjects, risk factors for delirium were cognitive impairment (relative risk, or RR, 3.6; 95% confidence interval, or CI, 1.8–7.2), abnormal blood pressure (RR 2.3, 95% CI 1.2–4.7), and heart failure (RR 2.9, 95% CI 1.6–5.3). Patients who received less than 10 mg of parenteral morphine sulfate equivalents per day were more likely to develop delirium than patients who received more analgesia (RR 5.4, 95% CI 2.4–12.3). Patients who received meperidine were at increased risk of developing delirium as compared with patients who received other opioid analgesics (RR 2.4, 95% CI 1.3–4.5). In cognitively intact patients, severe pain significantly increased the risk of delirium (RR 9.0, 95% CI 1.8–45.2).

Conclusions. Using admission data, clinicians can identify patients at high risk for delirium following hip fracture. Avoiding opioids or using very low doses of opioids increased the risk of delirium. Cognitively intact patients with undertreated pain were nine times more likely to develop delirium than patients whose pain was adequately treated. Undertreated pain and inadequate analgesia appear to be risk factors for delirium in frail older adults.

Siu AL et al, Arch Intern Med 2006

Considerazioni -2

- La frattura di femore è un “complex journey of care” che costringe il paziente ad uno stress clinico e ambientale e l’organizzazione ad uno stress organizzativo notevoli
- Le variabili che influenzano l’outcome non sono legate soltanto al tipo di frattura ed all’intervento chirurgico in se ma coinvolgono aspetti della care che più propriamente sono tipici della cultura e dell’approccio geriatrici

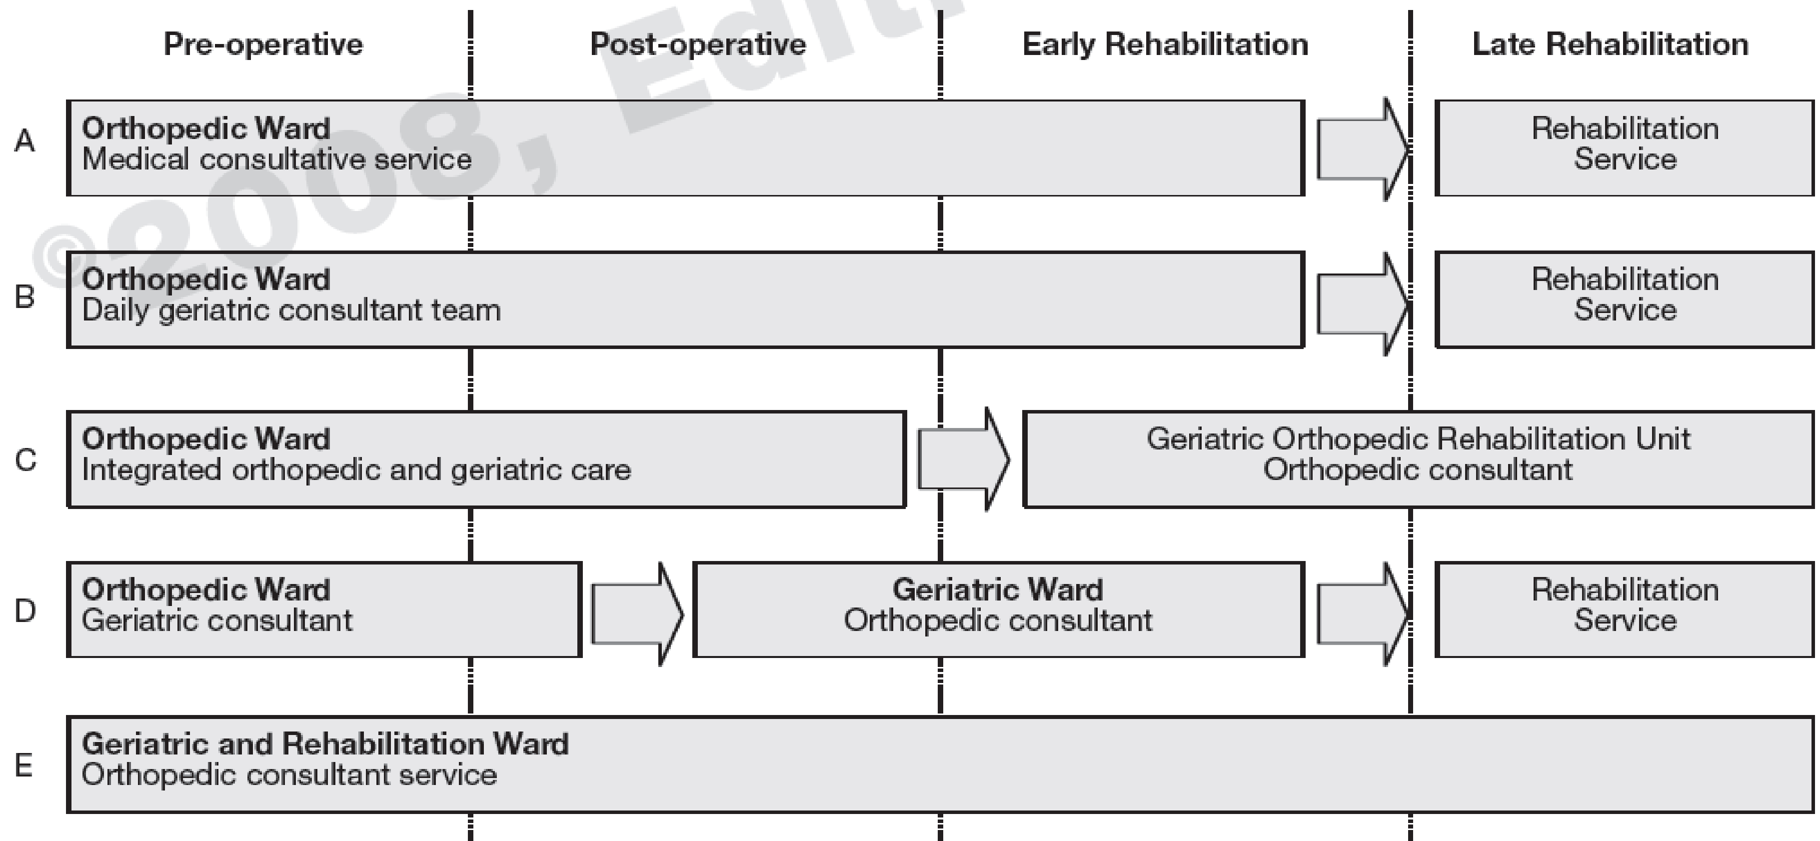
Outline

- Il contesto epidemiologico
- Il significato clinico dell'ortogeriatria
- I diversi modelli di ortogeriatria e le evidenze scientifiche sull'efficacia
- Le questioni irrisolte
- Conclusioni

I'm only a humble carpenter and I need a physician to tell me what's wrong with the patient"

Devas MB, 1947

Patients pathways in different models of hip fracture care



©2008, Editr...

Pioli G et al, Aging Clin Exp Res 2006

Considerazioni

- Modelli eterogenei
  - differenti organizzazioni “ospedaliere”
  - differenti sistemi di pagamento
  - differenti figure (team) coinvolti
- Differenti misure (e tempi) di outcomes
- Carenza di RCT, con risultati contrastanti

Interdisciplinary inpatient care for elderly people with hip fracture: a randomized controlled trial

Variable	Group; no. (and %) of subjects: Interdisciplinary care	Usual care	Difference* (and 95% CI)
Death†			
3 mo			7)
6 mo			9)
Decline in ambulation‡			
3 mo§			3)
6 mo			.3)
Decline in transfers‡			
3 mo§			.2)
6 mo	(36.3)	44 (37.6)	–1.3 (–13.5 to 10.9)
Change in residence‡			
3 mo	31 (23.7)	32 (25.4)	–1.7 (–12.3 to 8.8)
6 mo	22 (17.7)	23 (19.7)	–2.0 (–11.8 to 7.9)

Note: CI = confidence interval.
*Absolute difference between percentages for each group.
†Determined on the basis of the entire sample of 141 patients receiving interdisciplinary care and 138 patients receiving usual care.
‡Determined on the basis of surviving patients only: 131 patients receiving interdisciplinary care and 126 receiving usual care at 3 months, and 124 patients receiving interdisciplinary care and 117 receiving usual care at 6 months (see also additional note concerning missing data at 3 months for some variables).
§Data were missing for 3 patients receiving interdisciplinary care and 8 patients receiving usual care.

The subgroup analysis (based on cognitive status) showed a trend for benefit of interdisciplinary care in patients with mild to moderate cognitive impairment.

Il ritardo chirurgico ha lo stesso impatto nei pazienti fit e nei pazienti unfit?

Early Mortality After Hip Fracture: Is Delay Before Surgery Important?

By Christopher G. Moran, MD, FRCS(Ed), Russell T. Wenn, BA,
Manoj Sikand, MS, FRCS, and Andrew M. Taylor, DM, FRCS

There was no a priori protocol for determining which patients were unfit for surgery and anesthesia, a judgment that will always vary between clinicians. However, the striking difference in mortality between the patients deemed to be fit for surgery and those considered to be unfit for surgery indicates that current clinical methods are successful in identifying patients who are at increased risk of death following hip fracture surgery. This important subgroup of patients requires separate analysis in future studies, and any national audit should also include a separate analysis of these patients, who could have an important effect on the observed mortality in individual trauma units.

J Bone Joint Surgery, 2005

The combined effect of ADL impairment and delay in time from fracture to surgery on 12-month mortality: an observational study in orthogeriatric patients

Giuseppe Bellelli, MD*,†,#, Paolo Mazzola, MD*, Maurizio Corsi, MD*, Antonella Zambon, PhD§, Giovanni Corrao, PhD§, Giuseppe Castoldi, MD‡, Giovanni Zatti, MD‡, Giorgio Annoni, MD*

- **Objective:** To assess the effect of delayed hip fracture surgery on 1-year mortality according to the existence of a pre-fracture Activity of Daily Living (ADL) impairment.

Clinical and functional characteristics of 377 patients consecutively discharged alive from an Orthogeriatric unit, according to mortality at 1-year follow-up.

	Alive (n=281)	Dead (n=96)	P
Age, years	83.1±6.1	85.0±7.0	.01
Gender, female	237 (84.3)	74 (77.1)	.10
From NH	33 (11.7)	10 (10.4)	.72
Femoral neck fracture	129 (49.8)	44 (50.6)	.75
Late surgery (> 48h)	142 (50.5)	68 (70.8)	.0005
Pre-fracture dependence in 2+ ADL	152 (54.1)	82 (85.4)	<.0001
Charlson Index	2.9±2.0	4.2±2.5	<.0001
Pre-fracture cognitive impairment	145 (51.6)	67 (69.8)	.002
Albumin gr/dl	3.2±1.3	3.1±1.3	.76
Post-operative delirium	89 (31.7)	52 (54.2)	<.0001
LOS	14.1±5.1	16.2±7.0	.008

	No ADL impairment		ADL impairment	
	No delay (n=66)	**Delay (n=78)**	**No delay (n=107)**	**Delay (n=139)**
Age, years	81.7±5.3	80.2±5.9	85.7±6.4	85.2±6.1
Females, n (%)	51 (77.3)	63 (80.8)	93 (86.9)	112 (80.6)
Place of fracture				
Home, n (%)	51 (77.3)	54 (69.2)	78 (72.9)	115 (82.7)
Out of home, n (%)	15 (22.7)	22 (28.2)	5 (4.7)	7 (5.0)
Nursing home, n (%)	--	2 (2.6)	24 (22.4)	17 (12.2)

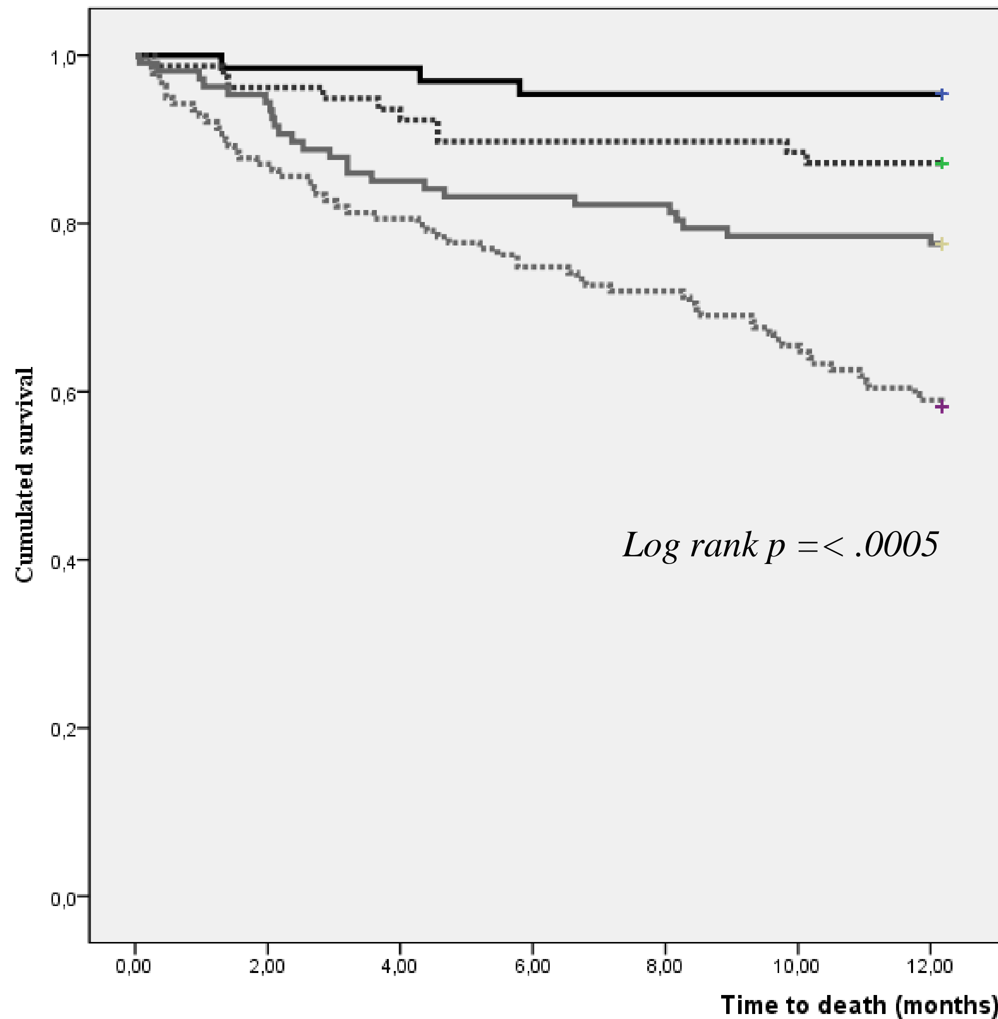
ASA score	2.4±0.5	2.7±0.6	2.8±0.5	2.9±0.5
Dementia before fracture, n (%)	1 (1.5)	1 (1.3)	55 (53.9)	72 (54.5)
Post-op delirium, n (%)	7 (10.8)	13 (16.7)	50 (40.9)	71 (53.8)
LOS of post-surgery, days	11.0±5.3	11.9±4.8	11.1±4.5	11.8±5.7
Discharge to rehab, n (%)	65 (100)	76 (97.4)	72 (70.6)	103 (78.0)
Discharge to NH, n (%)	0	0	25 (24.5)	17 (12.9)
Discharge to home with support	0	2 (2.6)	5 (4.9)	12 (9.1)

Figure. 1-year cumulative survival, according to delay in surgical intervention and ADL impairment (n=377 pts)



Legend: black solid line = no dealy-no ADL impairment; black dotted line = delay- no ADL impairment
grey solid line = no dealy- ADL impairment; grey dotted line = delay-ADL impairment

Results of Multivariate Proportional Hazards Analysis of 1-Year Mortality

Variable	H.R.	95% Confidence Intervals	P
Age, years	1.03	1.00 to 1.07	.006
Male/female	1.81	1.11 to 2.96	.001
Charlson Comorbidity Index (2-3)	1.15	1.04 to 1.28	.006
Drugs	0.98	0.90 to 1.07	.70
Post-operative delirium	1.64	1.03 to 2.61	.03
ASA score	0.95	0.60 to 1.52	.83
Dementia (present/absent)	0.66	0.38 to 1.15	.14
Delay-No ADL impairment	2.96	0.80 to 10.89	.10
No Delay-No ADL impairment	5.46	1.52 to 19.70	.009
Delay-ADL impairment	8.93	2.55 to 31.28	.0006

Comments

- Delayed surgery is associated with late mortality (1-year follow-up)
- The effect of delayed surgery on 1-year mortality is magnified in HF patients with ADL impairment before fracture
- Delirium & comorbidity are also independent predictors of mortality
- How to speed time of intervention among ADL-impaired patients (with delirium & comorbidity)?
